

SPECIFICATION

PAGE 5

Please delete the paragraph spanning lines 19-27, and insert the following replacement paragraph:

The vibration exciter is adapted to apply force to the lever or flange generally normal to the plane thereof, or alternatively the vibration exciter may be adapted to apply force to the lever or flange generally in the plane of the panel thereof. In this latter case, the panel may operate in whole body mode at low frequencies, and the lever or flange may comprise a return lip at its end remote from the panel, so that the vibration exciter may be coupled to the return lip.

ABSTRACT

Please insert the following sheet, which contains only the abstract, after the claims.
